

Support HB 1779

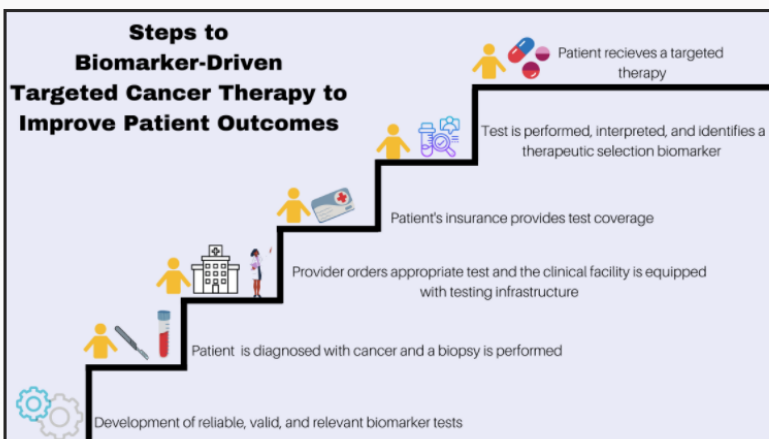

Sen Munoz/Rep Flowers

HB 1779 will expand appropriate coverage of biomarker testing for state-regulated public and private insurance plans.

What is biomarker testing?

A “biomarker” is a sign of disease or abnormal function that can be measured in blood, tissue or bodily fluid. In cancer care, biomarkers are often used to help determine the best treatment for a patient. Biomarker testing is the analysis of a patient’s tissue, blood or fluid biospecimen for the presence of a biomarker. Biomarker testing includes single-analyte tests, multi-plex panel tests, and partial or whole genome sequencing. Biomarker testing is an important step to accessing precision medicine which includes targeted therapies that can lead to improved survivorship and better quality of life for patients.

Timely access to guideline-indicated comprehensive biomarker testing can help achieve the triple aim of health care including better health outcomes, improved quality of life and reduced costs.

When doctors connect patients to the most effective treatment for their cancer, patients can avoid treatments that will be ineffective or have more adverse effects.

Biomarker testing & health equity:

- Not all Illinois communities are benefitting from the latest advancements in biomarker testing and precision medicine. Communities that have been marginalized including communities of color and individuals with lower socioeconomic status are less likely to receive biomarker testing.
- People in rural communities and those receiving care in nonacademic medical centers are also less likely to benefit from biomarker testing.
- **Ensuring equitable access to biomarker testing by improving coverage for and access to testing across insurance types is key to reducing health disparities.**
- Insurance coverage for biomarker testing is failing to keep pace with innovations and advancements in treatment. There is currently limited and disparate access to biomarker testing, which is key to connecting some patients with the most effective treatments. Improving access to biomarker testing - and thereby access to targeted therapies - is a strategy to reduce health disparities and improve outcomes for patients facing diseases like cancer.

**GETTING THE RIGHT TREATMENT
TO THE RIGHT PATIENT
AT THE RIGHT TIME**
