Lung cancer screening should only be done at a center that knows how to do it, like a GO2 for Lung Cancer Center of Excellence. Contact GO2 for Lung Cancer to learn more about screening and find out where to get a low-dose CT scan.

What is screening?
Screening checks to see if there is disease in people who do not have symptoms.

Why screen for lung cancer?
Lung cancer screening can find lung cancer before you have symptoms when it can be easier to treat and may be cured.

Website: go2.org
**Lung cancer screening**

- Uses a low-dose CT scan
- The scan takes 1 minute
- No needles are used

**Medicare and most private insurance pays for lung cancer screening if you meet certain guidelines. Medicaid also covers screening in most states.**

**Should I get screened?**

**50**

Are you 50 or older? And

Do you smoke now? Or, if you quit, was it in the last 15 years? And

Do you smoke (or did you smoke) at least one (1) pack a day for 20 years or two (2) packs a day for 10 years?

If you answer yes to these questions, ask a member of your healthcare team for a low-dose CT scan. If you answered no to any of these questions but have concerns or questions about your health, talk to a member of your healthcare team.

**Other things to know**

- For most people, screening is done once a year.
- Screening with a low-dose CT scan can find spots in the lung, called nodules, that can’t be seen on an X-ray.
- Like with skin moles, most lung nodules are not cancer and will never become lung cancer.
- Also like moles, it is a good idea to watch nodules over time to see if they grow or change.

You will need a written order to get a low-dose CT scan.
